

Adrian de Wynter

adewynter@microsoft.com | Homepage | Google Scholar

My main research interests is cognition in machines (language, understanding, reasoning, etc.), and measurement in science (especially post-AI). These two are deeply related, since scientific research on cognitive capabilities require carefully-designed experiments and assumptions to draw trustworthy conclusions. I also do research on computational social science; namely, the impact of LLMs and AI in society.

Education

BSc in Engineering, BSc in Physics (double major) 2011-2015
Massachusetts Institute of Technology

MSc in Computer Science 2021
University of Texas at Austin

PhD in Computer Science (ABD; 2022-Oct 2026 exp.)
University of York
Thesis: Understanding and Persuasion in Large Language Models
Advisor: Tangming Yuan
Probes the relationship between cognitive capabilities of LLMs; namely, understanding in an informal-logic context (how do you define it? How do you measure it?) and how this works internally.

Employment

Principal Applied Scientist 2022-Present
Microsoft Experiences + Devices
I am science lead for the design and deployment Word- and Office- AI features and research. Ex.: Copilot-wide language expansion (42 languages and cultures and a considerable part of its revenue); prompt suggestions and rewrite in Word (both the highest-acceptance-rate features); evaluation harnesses for Word Agent (trustworthy, reliable, and predictive). All stem from or led to publications at major venues. My focus at the moment is cognition (reasoning, understanding) and measurement (meta-science, evaluation). My current day-to-day centres on long-and-medium term investments related to evaluations of and with LLMs/agentive systems, and leading various (at the moment, 6) teams between research and product. I also start and drive university collaborations (currently BC, KAIST, Columbia, INRIA, and IIT-H).

PGR 2022-Present
University of York Department of Computer Science
I'm a researcher (PGR) in a part-time capacity. My research focus is in exploring epistemic questions around the relationship between understanding and reasoning in LLMs, especially (but not limited to) how it relates to dialogical components such as argumentative reasoning and persuasion. I also mentor MSc and BSc students in their theses.

Applied Scientist 2017-2021
Amazon AWS, Alexa
I worked at Amazon Rekognition (helped launch the video version), AWS (forecasting models for call centres), and Alexa (focused on highly efficient models).

Physical AI Safety Consortium 2026 - present
Researcher

Awards

My work has been covered by venues such as IBM, PC Magazine, Tom's Hardware, 404 Media, and the Turing Post. See my website for links to these.

The Turing Post: 23 Research Papers That Hint Where AI Is Heading Selected ‘Is In-Context Learning Learning?’ for its 2025 research roundup.	2025
Microsoft CELA Open Data Award For the MCFM corpus, a dataset for misgendering detection in 42 languages and dialects.	2025
Microsoft CELA Open Data Award For the CLANDESTINO corpus, a dataset for localized Spanish toxic-language detection.	2023
Microsoft CELA Open Data Award For the RTP-LX corpus, a dataset in 38 languages for toxic-language detection.	2023

(Selected) Invited Talks

Assumptionless Machine Cognition Invited talk at the German Research Centre for Artificial Intelligence (DFKI; 2026). Shortened abstract: I will present a research programme for studying machine cognition without dismissing these behaviours as autocompete, nor anthropomorphising them. We’ll discuss evidence of genuine-but-shallow learning and comprehension capabilities and the meta-scientific crisis this creates; and how they relate to debates on emergence, fairness, and the impact of deploying systems we barely understand.	2026
Keynote: Some Issues in Machine Cognition BoF at ACL 2026: Social Agents in the Wild: Reasoning, Simulation and Evaluation. Cognition in AI systems is tricky: we do not know how to measure it, and the current claims rely too much in anthropomorphism. In this talk I will describe hurdles, solutions, and emerging results within the field.	2026
The Document Manipulation Benchmark: Challenges in Agentic Document Manipulation LREC Industry Day: we pose that agentic complexity requires both fine- and coarse-grained measurements to better quantify efficiency and technological leaps.	2026
Will GPT-4 (and 5!) Run DOOM? ACM I3D SIGGRAPH Symposium on Computer Graphics: measuring cognitive capabilities (spatial orientation, object permanence, etc) from the lens of videogames.	2026
Evaluation of LLMs: Challenges and Directions Invited talk at MBZUAI’s Research Showcase. We pose that in order to perform accurate scientific measurement with LLMs it is needed to lift some pre-existing assumptions on what it means to measure things in science.	2025
The Curse of the Biased Researcher: Common Pitfalls in LLM Evaluation Microsoft Machine Learning and Data Science (MLADS) Conference: I point out that because LLMs sound reasonable, that does not mean that their output is.	2023
On the Opportunities and Dangers of LLM-Based Evaluation Microsoft Machine Learning and Data Science (MLADS) Conference: I pose that LLMs are unable to reason fully over their input, and thus the pre-supposed assumption that an LLM will be an appropriate evaluator is false. This eventually became my paper ‘Is In-Context Learning Learning?’.	2023

(Selected) Publications

Is In-Context Learning Learning? Experimentally determines whether the in-context learning (ICL) mechanism constitutes learning in the sense of Valiant (1984). It finds that yes, ICL can learn from unseen distributions—even independently of natural language—but it is brittle to multiple conditions, such as in versus out-of distribution inputs.	ICLR 2026
The Thin Line Between Comprehension and Persuasion in LLMs It measures whether LLMs can understand arguments. This is done through both language- and imitation-game-inspired measurements. It finds that the measurement radically changes the results: one indicates lack of comprehension, and the other shows signs of understanding. It concludes by posing the question as to whether it matters that LLMs cannot fully show comprehension of the context.	ACL 2026
Will GPT-4 Run DOOM? Staring by posing a seemingly meme-like question the paper shows that videogames are excellent evaluation	IEEE ToG 2024

harnesses for LLMs due to the dynamicity of their environment. The paper, and its 2026 invited talk at I3D SIGGRAPH also finds that LLMs like GPT-5 and Phi-4 have lacking spatial reasoning and long-term planning capabilities, but aren't entirely devoid of these.
